

# Understanding Sewage Systems in Ontario

## Wastewater, Re-inspections, and System failure

Eric Kohlsmith  
Manager, Upper Watershed Regulations  
Rideau valley Conservation Authority

July 12, 2023

# Ontario Building Code

---

TREATMENT PARAMETERS

CLASSES OF SYSTEMS

# What is Wastewater?

---

Sanitary sewage Definition - Division A, Part 1.4.1.2.):

liquid or water borne waste, of industrial or commercial origin, or of domestic origin, including human body waste, toilet or other bathroom waste, and shower, tub, culinary, sink and laundry waste

*Greywater - sanitary sewage of domestic origin which is derived from fixtures other than sanitary units*

# What is Treated?

---

```

```

Nutrients

Organics

Solids

# MAIN TREATMENT PROCESSES

# Classes of Sewage Systems

# Class 1 – Privies

---

- Composting toilets are a Class 1
- No permit required for installation
- Construction requirements and SEPARATION distances provided in Ontario Building Code and can be enforced

# Class 2 – Greywater Pit

- Also known as :
  - French Drain
  - Dry Well...
- Can only accept waste from fixtures – i.e. sinks, showers...
- Permit required prior to construction
- Systems can be very large depending on conditions

# Class 3 - Cesspool

- Only accepts waste from a Class 1 system
- Permit required prior to construction
- Not very common

## Class 4 – Septic Tank & Distribution Field

---

- Most common system
- Accepts both black water and greywater
- Different configurations:
  - Conventional –
    - Trench bed & Filter media
  - Level IV Treatment –
    - Type A & B, SBT
    - BMEC approved
- Level IV treatment
  - Higher level of effluent quality
    - better for the environment
  - Overall system size can be smaller
    - less imported fill

# Class 5 – Holding Tank

---

- No on-site treatment or disposal of sewage
- Not very common in recent years – all other avenues exhausted prior to installation
- Signed Agreement required with Licensed Sewage Hauler
- Minimum tank size is 9000L

## When are Permits Required

Building a new home/building that is not serviced by sewer

Renovating - adding bedrooms, plumbing fixtures or increasing finished floor area by more than 15%

Replacing a failed system

Altering or remediating any part of the system

Property Owner is responsible for the design, construction, operation and maintenance of the Sewage System

# All Systems Will Fail

# Biomat

Conventional  
system  
biomat is  
part of  
treatment

Initial biomat  
forms at  
sand stone  
interface

Biomat will  
build up over  
time

Biomat is  
typically not  
an issue with  
advance  
treatment

# *Consequences Of Biomat*

---

- Sewage unable to travel into the soil
- Backup into septic tank or house
- Sewage break out on top of leaching bed

# Impacts

## Can failing septic systems affect human health?

**Yes**

- A failing septic system likely discharges untreated wastewater, which contains pathogens (e.g., *E. coli*), nutrients and other harmful substances directly into the groundwater or onto the ground and into surface waters.

## Do septic systems impact water quality?

**Yes**

- Groundwater contamination with pathogens, chemicals or nutrients that affect drinking water wells.
- Surface waters can be contaminated with pathogens, such as *E. coli*, chemicals, and nutrients including nitrogen and phosphorus.
- Freshwater rivers, lakes, and ponds are more sensitive to phosphorus contamination from failing septic systems.
- Pathogens can cause illnesses for recreational swimming areas, even requiring beach closures and hazards to humans and pets. Excess nitrogen and/or phosphorus can cause an overgrowth of blue-green algae or cyanobacteria in a short period of time, triggering algae blooms.

## Misunderstandings/Myths

---

Effluent  
filters  
don't  
work

- Maintenance required

# Misunderstandings/Myths

---

## Seasonal Septic Tanks don't need to be pumped

Lack of use  
results in less  
break down of  
material

Diet, water  
quality/quantity,  
medications,  
frequency of  
use,... affect  
treatment

Most systems  
need to be  
pumped every 3-  
5 years –  
including  
seasonal

# Sewage System Re-inspections

---

# Understanding Septic Re-Inspections

---

Programs generally based around  
Section 8.9 of the Ontario  
Building Code:

- How systems are to function
- Operated and Maintained in accordance to the Act or predecessor legislation
- When systems need to be pumped / sampled / inspected

# Understanding Septic Re-Inspections

---

Impacts of a malfunctioning or failed system include:

- Environmental degradation
- Public health risks
- Depreciated property values.

Inspections 2023

```
graph TD; A[Inspections 2023] --> B[115 Completed]; B --> C[17 to be inspected]; C --> D[Report to Council – Fall 2023];
```

The diagram is a vertical flowchart with four blue rectangular boxes of decreasing width, each containing a step in the inspection process. The boxes are connected by downward-pointing arrows. The first box is dark blue and contains the text 'Inspections 2023'. The second box is a slightly lighter blue and contains '115 Completed'. The third box is a medium blue and contains '17 to be inspected'. The fourth box is the lightest blue and contains 'Report to Council – Fall 2023'. The entire flowchart is set against a white background with a solid blue horizontal bar at the bottom.

115 Completed

17 to be inspected

Report to Council – Fall 2023

Thank you
